

## HW3

### 109550134 梁詠晴

How I do my homework:

功能簡介: 按1和初始為Phong shading, 按2是Gouraud shading, 按三是Toon shading, 按四是edge effect。

Status控制:

```
phongProgram = createProgram(phong_vertexShader, phong_fragmentShader);
toonProgram = createProgram(toon_vertexShader, toon_fragmentShader);
edgeProgram = createProgram(edge_vertexShader, edge_fragmentShader);
gouraudProgram = createProgram(gouraud_vertexShader, gouraud_fragmentShader);

if (status == 1) { //phong
    currentProgram = phongProgram;
}
else if (status == 2) { //change color
    currentProgram = gouraudProgram;
}
else if (status == 3) { //color+deformation
    currentProgram = toonProgram;
}
else if (status == 4) {
    currentProgram = edgeProgram;
}
```

偵測按鍵改變status, 並依照目前status改變使用的vertex shader和fragment shader

Shader實作:

1. Phong shader: 在fragment shader中利用model參數、light參數計算ambient、diffuse、specular,  $\text{color} = \text{ambient} * \text{obj\_color} + \text{diffuse} * \text{obj\_color} + \text{specular}$
2. Gouraud shader: 在vertex shader中利用model參數、light參數計算ambient、diffuse、specular, 傳入fragment shader中再計算 $\text{color} = \text{ambient} * \text{obj\_color} + \text{diffuse} * \text{obj\_color} + \text{specular}$
3. Toon shader: 在fragment shader中計算diffuse, 根據光照情形分區, 使區塊內亮度統一, 再乘上obj\_color
4. Edge effect: 利用camera和normal計算角度, 找出垂直的區域(edge), 並使edge等於固定顏色、其餘區域為黑色

另外, 使用ModelVAO、DrawModel兩個function處理VAO、畫出model

ModelVAO: 3個VBO分別存model的positions、normals、texcoords資訊

DrawModel: bind對應VAO並畫出來

Problems:

需要計算camera位置時不小心用到worldPos而使結果錯誤, 發現後從main中傳cameraPos得到正確數值
